Component Parameter Test Instruments

C. TH2828/TH2828A Precision LCR Meter TH2828S Automatic Component Analyzer

Features

- Auto balancing bridge method with the widest impedance measurement range
- 4-terminal pair configuration to eliminate electromagnetic couple of test leads
- Basic accuracy: 0.05 %(TH2828/TH2828S), 0.1 %(TH2828A)
- Maximum test frequency up to 1 MHz
- AC test signal programmable to 20V (optional)
- Maximum measurement speed up to 30 meas/sec
- 6-digit display resolution
- 22 parameter combinations available
- Output signal Impedance: 30 Ω and 100 Ω selectable
- 10 points list sweep function
- Internal DC bias source ± 40V/100mA(optional)
- External DC bias 40A (optional two paralleled TH1776)
- Automatic level control function (ALC)
- Test signal level monitor function
- 20 control settings files can be saved in the internal non-volatile memory
- Built-in comparator:10-bins and bin counters
- RS232C, HANDLER, GPIB (option for TH2828A)
- 2m/4m cable length extension
- USB interface for external memory of set data
- 320×240 dot-matrix large graphic LCD display
- Chinese and English language user interface selectable

TH2828/TH2828A/TH2828S

Brief Introduction

■ TH2828/TH2828A/TH2828S is a new generation impedance test instrument with the most advanced technique of auto balancing bridge in the world.It fulfills all the measurement needs for components and materials with its high basic accuracy (0.05%/0.1%),wide frequency range (from 20 Hz to 1MHz) and impedance range (up to 100MΩ).The instrument is especially suitable for low dissipation factor(D)capacitor and high quality factor (Q) inductor measurement .The high power measurement conditions of up to 20V test signal level and 40 A DC bias current and list sweep function make it easy to extend user's capability of component evaluation.Four-terminal pair terminal configuration which eliminates the electromagnetic coupling of test leads,extends the low impedance measurement range ten times down of the normal five-terminal configuration instrument.

TH2828/TH2828A/TH2828S is a powerful tool for component design,component inspection,quality control and measurement on production line.It's also a powerful tool for design and research of circuit and materials(electronic material and non-electronic material). With its excellent performance,TH2828/TH2828A/TH2828S is in conformity with commercial and military standards,for example IEC and MIL standards.

Various Measurement Device

Passive:Impedance measurement of capacitor,inductor,magnetic core,resistor, transformer,chip module,network component,etc.

Semiconductor:Varactor C-V characteristic,parasitic parameter analysis of transistor and IC

Others:Impedance evaluation of PCB,relay,switch,cable,battery,etc.

Dielectric Material:Permittivity and dissipation angle evaluation of plastic, ceramic.etc.

Magnetic Material: Magneto conductivity and dissipation angle evaluation of ferrite, non-crystal materials.

Semiconductor Material:Permittivity,conductivity and C-V characteristics of semiconductor materials.

LCD Material: Permittivity, elasticity and C-V characteristics of LCD unit.

Versatile Component and Material Measurement Capability

Discovery the multi-characteristic of inductor

■ With its wide test frequency(20Hz--1MHz) and excellent performance,Th2828/TH2828A can accurately analyze the characteristics of inductor and magnetic materials.

By using the optional TH10301(100 mA DC bias source),TH2828/TH2828A can accurately analyze high frequency inductor,communication transformer and filter under low DC bias current.By using TH1775DC Bias Current Source,TH2828/TH2828A can analyze high power and current inductor under a DC bias current up to 40A.

Accurate measurement for ceramic capacitor

■ Ceramic material and capacitor are mainly measured under 1KHz and 1MHz. Most ceramic capacitors have the feature of low dissippation. The C and D parameters of a ceramic capacitor vary obviously with the test signal level.

With its wide test frequency, high accuracy, 6-digit resolution and automatic level control function (ALC), TH2828/TH2828A can measure the ceramic capacitor and material accurately and reliably.

Capacitance characteristic measurement for LCD Unit

 \blacksquare Capacitance -Voltage(C-V_{AC}) characteristic is the main characteristic used to evaluate a LCD material .For C-V_{AC} measurement ,general instrument has a weakness,whose maximum test voltage level is not high enough.

TH2828/TH2828A with the Optional TH10301 can provide a programmable test signal voltage up to 20 Vrms with 1% resolution. So TH2828/TH2828A can measure the C-V_{AC} characteristic of a LCD material under the most suitable condition you need.

Measurement for semiconductor material and component

■ Oxide-layer capacitance (Cox) and semiconductor impurity density are the main characteristics to evaluate a MOSFET.All of these parameters can be calculated from the measurement result of C-V_{DC}.

With its wide test frequency(20 Hz to 1 MHz) and internal $\pm40\rm V$ programmable DC Bias Soure.TH2828/TH2828A can measure the C-V_{DC} easily.

The extended cable and probe are needed for measuring semiconductor component on silicon-water. The optinal 2 m/4 m extended cable can efficiently reduce the error due to cable extension.

TH2828/TH2828A can also measure the parasitic parameters of diodes and transistors.

<u>Meeting the Measurement Needs in Various Fields</u>

R&D of New Materials and Components

■ The basic measurement accuracy of 0.05% / 0.1% greatly increases the measurement reliability of TH2828/TH2828A.With its

Component Parameter Test Instruments

C. TH2828/TH2828A Precision LCR Meter TH2828S Automatic Component Analyzer

6-digit resolution ,the instrument can identify the slight change of a component, especially for measuring the low dissipation capacitor.

Enhancing Production Line Efficiency

■ The high measurement speed (30meas/sec) can greatly increase test throughput.

The built-in comparator, cable length compensation and HANDLE interface make it easy to build an automatic component test system.

The internal non-volatile memory and USB disk can save the setting time and reduce operation errors.

User's Friendly Interface

Simple Operation of front panel

All control settings,softkeys and monitor information are directly displayed on the 320x240 dot-matrix large LCD. The interactive Softkeys make the key operation simple and efficient.

Non-volatile Memory for Storing Measurement Settings

■ TH2828/TH2828A's build-in non-volatile memory can save 20 control setting files. The USB disk(TH2828 only) makes it possible that the setting files can be shared by more instruments.Doing so will greatly reduce operation errors and enhance efficiency.

Flexible Data Communication modes

■ Th2828/TH2828A's GPIB interface(optional for TH2828A) makes it possible to build an automatic component test system and communicate with each other. On the other hand the low cost RS232 interface makes it easy to communicate with a computer.

General Specifications

Operation Temperature And Humidity		0°C - 40°C, ≤ 90%RH	
Power Requirements	Voltage	99V-121V AC,198V-242V AC	
	Frequency	47.5Hz - 63Hz	
Power Consumption		≤ 100VA	
Dimensions (W×H×D)		430mm×185mm×490mm	
Weight		Approx. 15 kg
